

IN THE CLAIMS:

Please amend claims 1-3, 6, and 7, and add new claims 11-20, as follows:

1. (Currently Amended) A card connector for holding either of first and second cards in a connector housing so that contact pads of the card engage contact terminals arranged in a base plate of the connector housing, the card connector characterized by:

A
wherein the being configured to hold a first card [[has]] having an upper body portion, a lower body portion formed slightly narrower than the upper body portion and having recessed portions on a bottom surface in a front side area thereof, contact pads provided in said recessed portions, and stepped portions formed along both side edges of the card by a bottom surface of said upper body portion and a bottom surface of said lower body portion, [[and]]

[[the]] being configured to hold a second card [[has]] having a card body portion having almost the same ~~horizontal shape and~~ thickness as the upper body portion of the first card, and contact pads arranged on a bottom surface of the card body portion at almost the same horizontal positions as the contact pads of the first card,

~~the card connector comprising:~~

having a pair of guide grooves formed in both side walls of the connector housing to support the side edges of the upper body portion of the first card and the side edges of the card body portion of the second card and thereby guide the first or second card as [[it]] the first or second card is inserted or extracted; [[and]]

having side walls to define, below a space between the pair of guide grooves, a space in which to accommodate the lower body portion of the first card; and
having a base plate and a plurality of contact terminals arranged in said base plate adapted to electrically couple with contacts formed on a bottom surface of said first and second cards.

2. (Currently Amended) A card connector according to claim 1, wherein said side walls are formed at such locations that [[they]] said side walls can guide the side surfaces of the lower body portion of the first card.

3. (Currently Amended) A card connector according to claim 1, further comprising:

an eject mechanism to eject the card; and

an elastic braking piece arranged at such a position that [[it]] the elastic braking piece engages the bottom surface of the upper body portion of the first card when the first card is inserted and engages the bottom surface of the card body portion of the second card when the second card is inserted, the braking piece applying a braking force to the first or second card when [[it]] the first or second card is ejected.

4. (Original) A card connector according to claim 3, wherein said elastic braking piece is secured to a position which is in a far part of said guide groove and which is a predetermined distance lower than a lower wall of said guide groove.

5. (Original) A card connector according to claim 1, wherein a housing top plate that forms upper walls of said guide grooves is formed with an opening having a width larger than that of the lower body portion of said first card.

AI
6. (Currently Amended) A card connector according to claim 1, wherein a housing top plate that forms upper walls of said guide grooves is formed with a recess having a width larger than that of the lower body portion of said first card ~~and receding in the height direction~~ and which extends into the underside of the top plate.

7. (Currently Amended) A card connector according to claim 1, further comprising:

an elastic braking piece arranged at such a position that ~~[[it]]~~ the elastic braking piece engages the bottom surface of the upper body portion of said first card when said first card is inserted and engages the bottom surface of the card body portion of said second card when said second card is inserted, the braking piece applying a braking force to said first or second card in a card extraction direction.

8. (Original) A card connector according to claim 7, wherein said elastic braking piece is secured to a position which is in a far part of said guide groove and which is a predetermined distance lower than a lower wall of said guide groove.

9. (Original) A card connector according to claim 7, wherein a housing top plate that forms upper walls of the guide grooves is formed with an opening having a width larger than that of the lower body portion of the first card.

10. (Original) A card connector according to claim 7, wherein a housing top plate that forms upper walls of said guide grooves is formed with a recess having a width larger than that of the lower body portion of said first card and receding in the height direction.

11. (New) A card connector for holding either of first and second cards in a connector housing so that contact pads of the card engage contact terminals arranged in a base plate of the connector housing, the card connector housing characterized by:

being configured to hold a first card having an upper body portion, a lower body portion formed slightly narrower than the upper body portion and having recessed portions in a front side area thereof, contact pads provided in said recessed portions, and stepped portions formed along both side edges of the card by a bottom surface of said upper body portion and a bottom surface of said lower body portion,

being configured to hold a second card having a card body portion having almost the same horizontal shape and thickness as the upper body portion of the first card, and contact pads arranged on a bottom surface of the card body portion at almost the same horizontal positions as the contact pads of the first card,

having a pair of guide grooves formed in both side walls of the connector housing to support the side edges of the upper body portion of the first card and the side edges of the card body portion of the second card and thereby guide the first or second card as it is inserted or extracted;

having side walls to define, below a space between the pair of the guide grooves, a space in which to accommodate the lower body portion of the first card, and

having an elastic braking piece arranged at such a position that the elastic braking piece engages the bottom surface of the upper body portion of the first card when the first card is inserted and engages the bottom surface of the card body portion of the second card when the second card is inserted,

wherein a displacement of the elastic braking piece remains about the same, when the first or second card is inserted.

12. (New) A card connector according to claim 11, wherein said side walls are formed at such locations that said side walls can guide the side surfaces of the lower body portion of the first card.

13. (New) A card connector according to claim 11, further comprising an eject mechanism to eject the card.

14. (New) A card connector according to claim 11, wherein said elastic braking piece is secured to a position which is in a far part of said guide groove and which is a predetermined distance lower than a lower wall of said guide groove.

21
15. (New) A card connector according to claim 11, wherein a housing top plate that forms upper walls of said guide grooves is formed with an opening having a width larger than that of the lower body portion of said first card.

16. (New) A card connector according to claim 11, wherein a housing top plate that forms upper walls of said guide grooves is formed with a recess having a width larger than that of the lower body portion of said first card and receding in the height direction.

17. (New) A card connector according to claim 11, wherein the elastic braking piece applying a braking force to said first or second card in a card extraction direction.

18. (New) A card connector according to claim 17, wherein said elastic braking piece is secured to a position which is in a far part of said guide groove and which is a predetermined distance lower than a lower wall of said guide groove.

21
19. (New) A card connector according to claim 17, wherein a housing top plate that forms upper walls of the guide grooves is formed with an opening having a width larger than that of the lower body portion of the first card.

20. (New) A card connector according to claim 17, wherein a housing top plate that forms upper walls of said guide grooves is formed with a recess having a width larger than that of the lower body portion of said first card and receding in the height direction.
